Keywords: perchlorate (chloride) of tropylium, aniline, arylamines, antimycobacterial activity.

Abstract

By tropylation of aniline with chloride or perchloride of tropylium we obtained 4-(7-cyclooctona-1,3,5-triene)aniline and its derivatives – muriate [4-(7-cyclooctona-1,3,5-triene)aniline]-HCl, n-N-acetylamino-4-(7-cyclooctona-1,3,5-triene)aniline and N-(n-dimethylaminophenylmethylene)-4-(7-cyclooctona-1,3,5-triene)aniline. The study of their biological activity has shown that 4-(7-cyclooctona-1,3,5-triene)aniline and its muriate showed antimycobacterial activity against a range of bacteria Staphylococcus aureus (St. aureus), Staphylococcus epidermis (St. epidermis), Staphylococcus saprophyticus (St. saprophyticus), Escherichia coli (E. coli), and yeast-like fungi Candida albicans (Cand. albicans).
